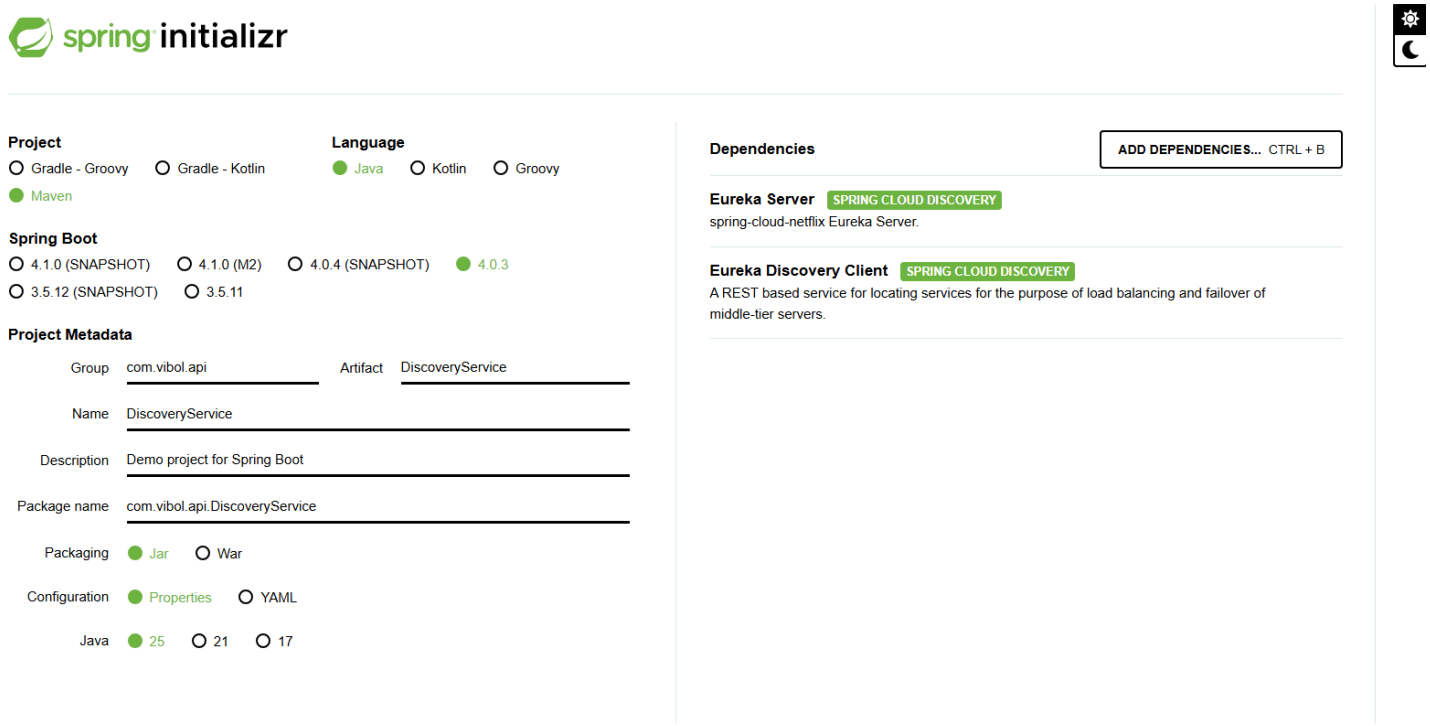
Create Eureka Discovery Service Project



- Create DiscoveryService add dependency both : Eureka Server and Client because it can talk to each other and get the register from the other Microservice
- create bootstrap.properties : starter before application.properties

1- ដំបូងបំផុត ប្រាប់ Spring Boot this is Eureka Service

Add the annotation on the application main running file

DiscoveryServiceApplication.java × application.properties bootstrap.properties

```java
package com.vibol.api.discoveryservice;

import org.springframework.boot.SpringApplication;
import org.springframework.boot.autoconfigure.SpringBootApplication;
import org.springframework.cloud.netflix.eureka.server.EnableEurekaServer;

@EnableEurekaServer  Alt+F Finish changes to file | Escape Dismiss
@SpringBootApplication
public class DiscoveryServiceApplication {

    public static void main(String[] args) { SpringApplication.run(DiscoveryServiceApplication.class, args); }

}
```

@EnableEurekaServer

2- Add the application.properties

- Create bootstrap.properties : this start first ដើម្បីកុំអោយវាឃើញ properties ច្រើនពេលក្នុង application.properties

>> spring.application.name=discoveryservice

```
application.properties
server.port=8010
eureka.client.register-with-eureka=false
eureka.client.fetch-registry=false

logging.level.com.netflix.eureka=OFF
logging.level.com.netflix.discovery=OFF
```

Explain:

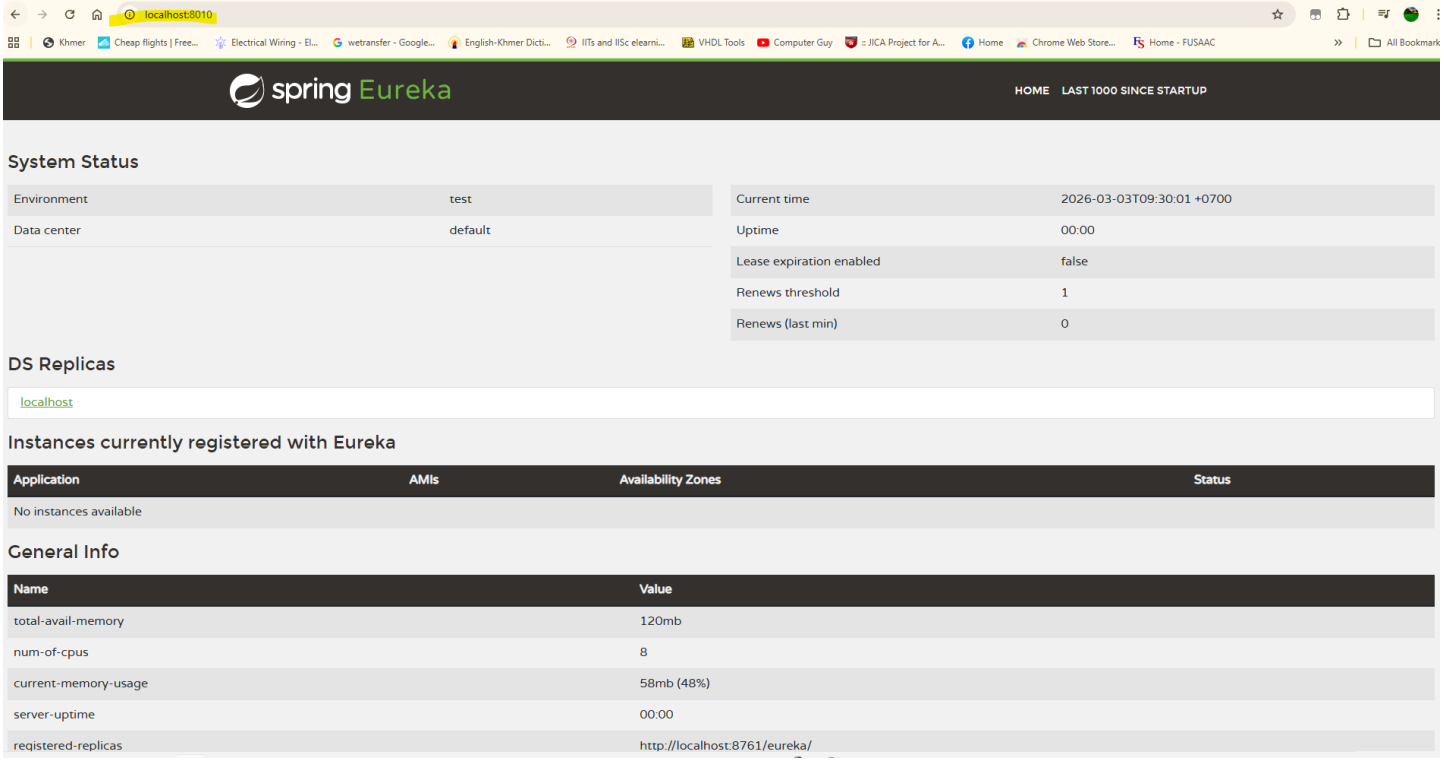
Configure Eureka:

- server.port=8010 : port number of Eureka

- eureka.client.register-with-eureka=false សម្រាប់ Server នឹងមិនអោយចុះឈ្មោះជាមួយ Eureka ផ្សេងទេ ព្រោះវា ជា Eureka server ហើយ ដោយសារតែពេលវា បើកមក វាធ្វើការ Register ដោយខ្លួនឯងផ្ទាល់ Do NOT register itself as a client in Eureka.

- eureka.client.fetch-registry=false (Do NOT fetch the service registry from Eureka.)

- logging.level.com.netflix.eureka=OFF (This disables logs related to: Netflix Eureka internal classes)

- logging.level.com.netflix.discovery=OFF (This disables logs related to: Netflix Discovery client internals)


Running the Eureka:
