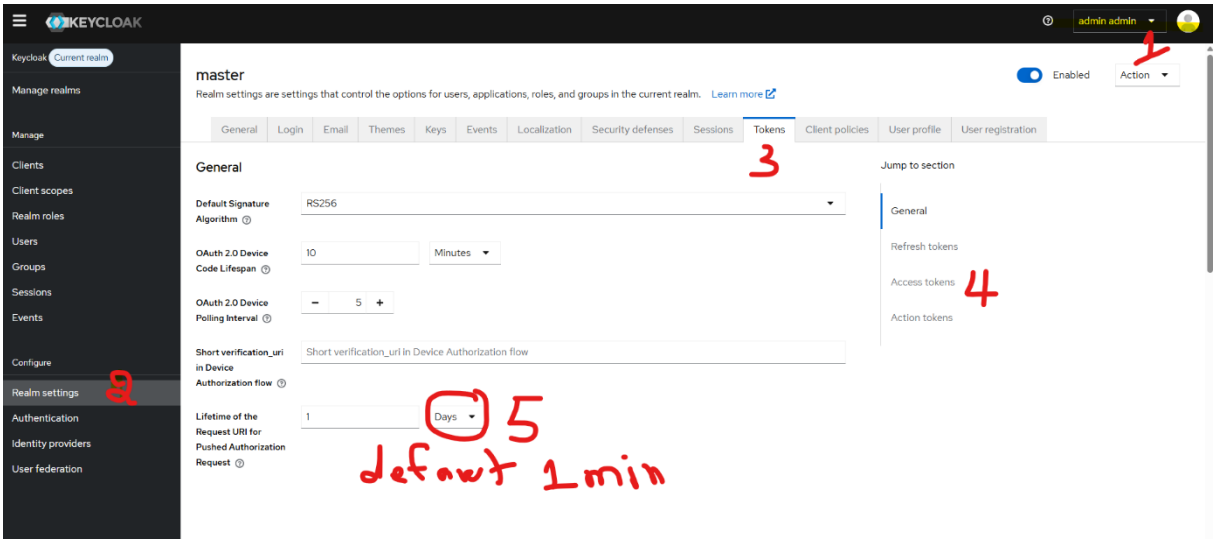
Client Authorization Code Lifespan:
អោយ code ដែលបានមកពី Keyloak Longer

How to fix this in Keycloak Settings

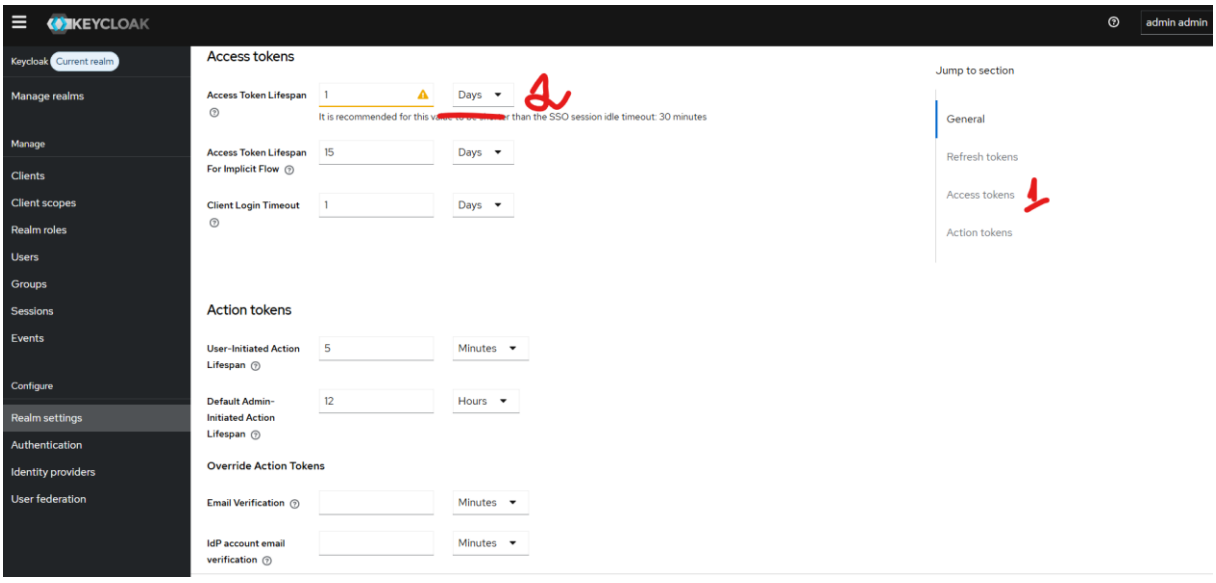
If you need more time to manually copy-paste the code into Postman for testing, you can increase the **Client Authorization Code Lifespan:**

1. Go to **Realm Settings** > **Tokens** tab.
2. Find **Client login timeout.** This controls how long the `code` remains valid.
3. Increase this from 1 minute to 5 or 10 minutes while you are debugging.
4. **Save** the settings.

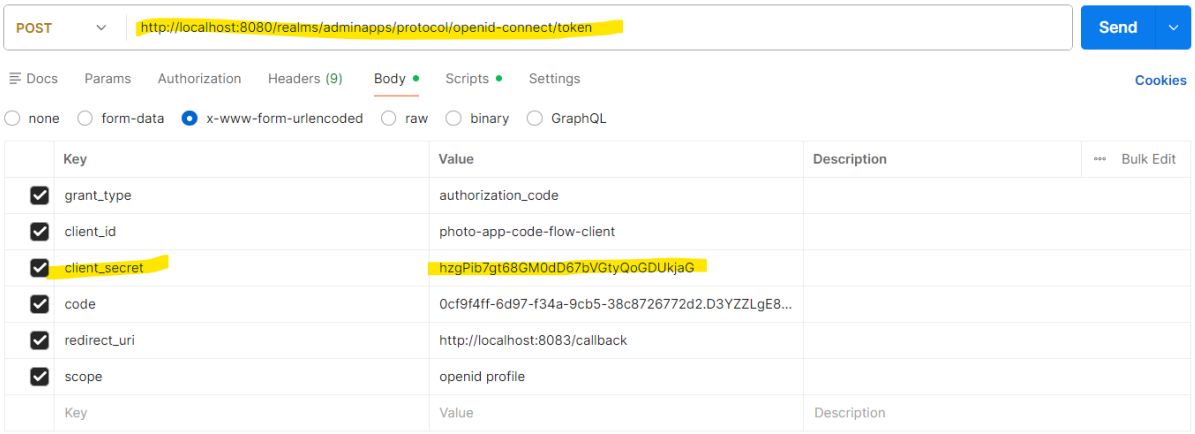
1-Login as administrator



2-Change Access Token time



Note: Client Secrets in Keycloak do not actually expire.



a Client Secret is a static credential. Once generated, it remains valid indefinitely until you manually click the Regenerate button shown in your image.
