@PostAuthorize

@PostAuthorize() អាចអោយគេបើ Method នឹងដំបូងបាន បន្ទាប់មកវាត្រូវធ្វើការផ្ទាង់ផ្ទាត់បើវាអត់ត្រូវទេ វានឹង មិនអាចអោយប្រើលើកក្រោយទេ.យើងចង់ផ្ទៀងផ្ទាង់ Id they access មកត្រូវឬអត់

1- Create controller

```
@PostAuthorize("returnObject.userId == #jwt.subject")
@GetMapping(path="/{id}")
public UserRest getUser(@PathVariable String id, @AuthenticationPrincipal Jwt jwt){
    return new UserRest( userFristName: "Vibol", userLastName: "long", userId: "80373687-a5e1-43d6-bbd8-36d421e760c5");
}

}
```

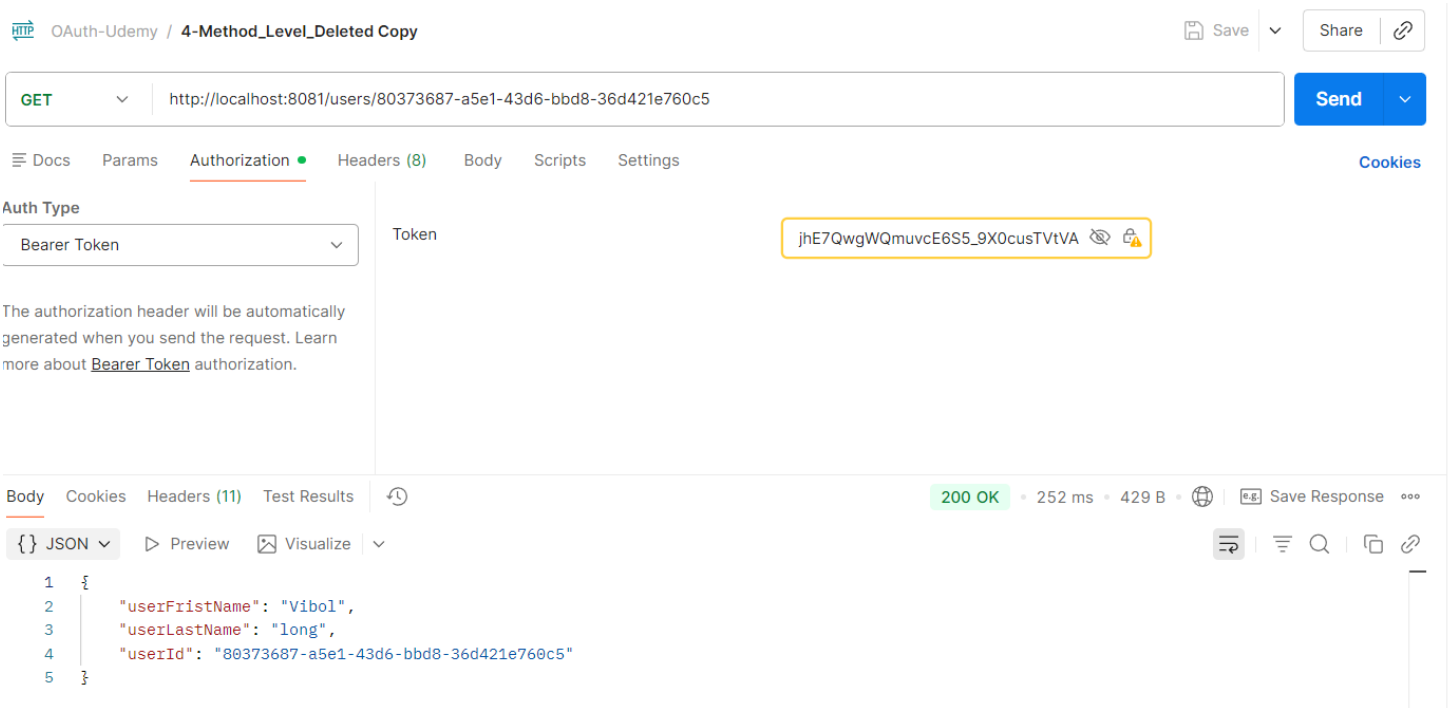
- @AuthenticationPrincipal Jwt jwt (inject jwt that we get)
- @PostAuthorize("returnObject.userId == #jwt.subject") this is the return object that we need to verify
- returnObject.userId (it is expression that can check the return object)

2-Create response Object User

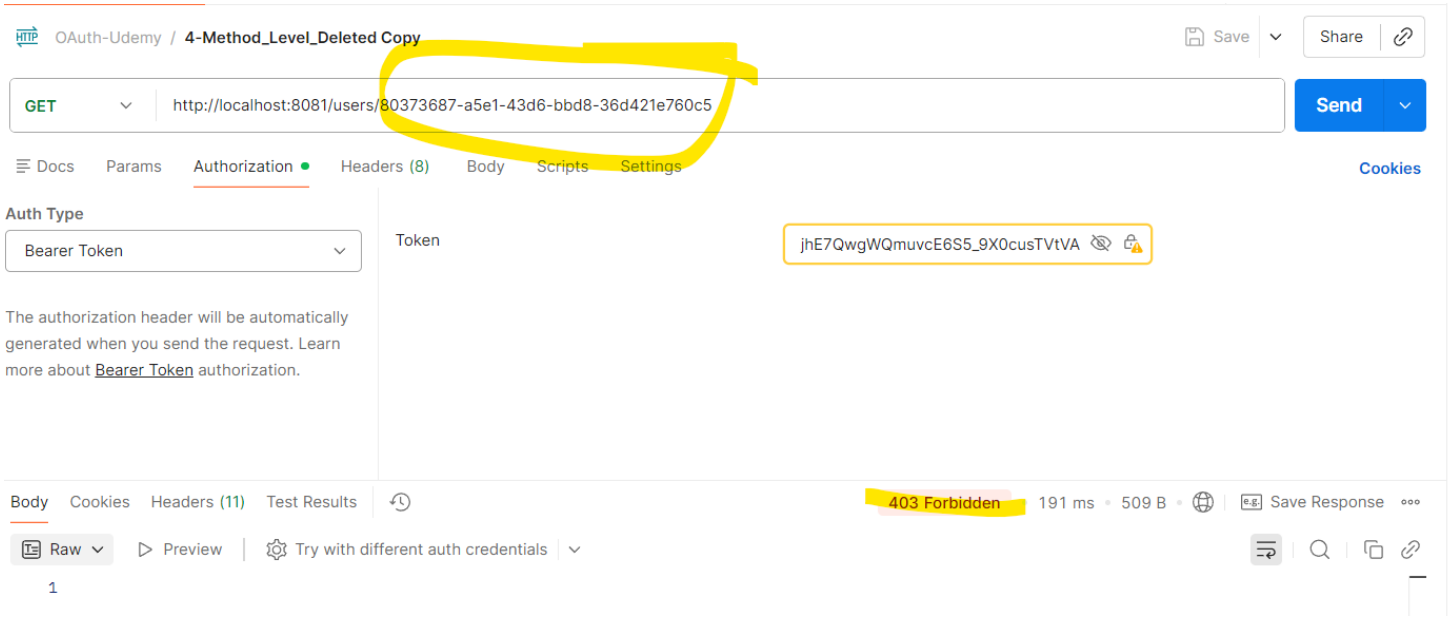
```
private String userFristName;
private String userLastName;
private String userId;
```

3- What we take note of is returnObject.userId (is the file return from user Response)

- If the sending the id send and the return difference, it will be rejected!



ករណីដែលយើងធ្វើការ change id in the returnObject to another it will 403 Forbidden



- Change id

```
@PostAuthorize("returnObject.userId == #jwt.subject")
@GetMapping(path="/{id}")
public UserRest getUser(@PathVariable String id, @AuthenticationPrincipal Jwt jwt){
    return new UserRest( userFristName: "Vibol", userLastName: "long", userId: "80373687-a5e1-43d6-bbd8-36d421e760c");
}

}
```
